DBMS LAB — EXPERIMENT 06

Stored Procedure, Triggers and Audit Log

Note: These are expected/representative outputs based on the described SQL and sample data, not screenshots from a live MySQL run. Exact formatting and EXPLAIN plans can vary by MySQL version.

Output 1: Successful stored procedure call

A valid call to transfer_employee should update the employee's department according to the procedure's parameters. Verify by selecting the employee row after the call.

Check	Expected result
Employee exists	Procedure continues
Destination department exists	Procedure continues
Valid transfer	Department ID is updated
Invalid employee ID	Error/validation message
Invalid department ID	Error/validation message

Output 2: Salary validation trigger

The trigger rejects a salary value that does not satisfy the script's validation rule (salary must be greater than zero in the provided experiment description). Exact SIGNAL text is the one declared in the SQL trigger.

Test	Expected result
Salary > 0	INSERT/UPDATE accepted
Salary = 0	Rejected by trigger
Salary < 0	Rejected by trigger

Output 3: Salary audit trigger

When an employee salary is changed successfully, the audit trigger inserts an audit record containing the employee identifier and old/new salary values (plus timestamp if defined by the table). A rejected salary update should not create a successful salary-change audit record.

Emp_ID	Old_Salary	New_Salary
Example employee ID	Previous salary	Updated salary

Important

These are expected behaviors, not literal server-captured outputs. Stored procedure messages and trigger errors must be checked against the exact SQL statements in your repository.
